THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN **THREE MONTHS FROM THE MAILING DATE OF THIS NOTICE** OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. **THIS STATUTORY PERIOD CANNOT BE EXTENDED.** SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE DOES NOT REFLECT A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE IN THIS APPLICATION. IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

DETAILED ACTION

Response to Amendment

The amendment to the claims filed 7/30/2008 has been entered into the application file and considered. The non-elected process claims have been amended to have the same limitations as the product claims of record and have been rejoined.

Claim Rejections - 35 USC § 102/103

The rejection of claims 1-2 and 7-8 under 35 U.S.C. 102(b) and 102(e) as being anticipated by, or in the alternative under 35 U.S.C. 103(a) as being unpatentable over Yasumoto et al. (WO 02/073721, US 2003/0087145 and US 6,991,870) has been overcome by applicant's amendment to the claims.

Allowable Subject Matter

Claims 1-10 are allowed.

The following is an examiner's statement of reasons for allowance:

The instant claims are to a fuel cell, comprising a first substrate provided with a gas flow path to supply a first reaction gas; a first electron collection layer formed on the first substrate; a first gas diffusion layer formed on the first electron collection layer; a first reaction layer formed on the first gas diffusion layer; an electrolyte film formed on the first reaction layer; a second reaction layer formed on the electrolyte film; a second gas diffusion layer formed on the second reaction layer; a second electron collection layer formed on the second gas diffusion layer; and a

second substrate provided with a second gas flow path to supply a second reaction gas, at least one of the first electron collection layer and the second electron collection layer constructed in porous form by stacking conductive material particles, the conductive material particles having at least one of a particle shape, an elliptical shape, and a cylindrical shape; and the at least one of the first electron collection layer and the second electron collection layer including a plurality of rows, with the conductive material particles in each row separated by gaps, a conductive material particle in one row being in contact with a conductive material particles in an adjacent row.

The prior art does not teach the invention, as claimed. The most pertinent prior art has been made of record. Yasumoto et al. teaches a fuel cell comprising a first substrate provided with a gas flow path, to supply a first reaction gas; a first electron collection layer formed on the first substrate; a gas diffusion layer formed on the first electron collection layer; a first reaction layer formed on the first electron collection layer; an electrolyte film formed on the first reaction layer; a second reaction layer formed on the electrolyte film; a gas diffusion layer formed on a second electron reaction layer, a second electron collection layer formed on the; and a second substrate provided with a second gas flow path to supply a second reaction gas (see figures 4, 5 10, and 11 and the corresponding text; see col. 7, lines 20-55.) The diffusion layer of the electrode includes two different layers. The first is a carbon layer that collects electrons and is adjacent to the separator plate. The second is also a diffusion layer adjacent to the reaction layer. At least one of the first electron collection layer and the second electron collection layer constructed in porous form by stacking conductive material particles (see figures 5, 7, and 10). The collection layer includes a plurality of rows, with the conductive material particles in each row separated by gaps (see figures 5, 7, and 10). A conductive material particle in one row is in

contact with conductive material particles in an adjacent row. The conductive material may be carbon or a metal. In the collection layer, cavities formed mainly between conductive carbon particles function as pores. Smaller conductive particles fall into the pores between larger particles of the diffusion layer. The area of the pores may be varied by changing the relative proportion of particles (col. 9, lines 1-10 and 35-end.) Figures 5, 7, and 9 show conductive carbon fibers that form pores in the layer. The carbon particles are in contact with conductive material particles in an adjacent row. Figure 10 shows rows of conductive material particles.

The reference does not teach that all particles are touching. Further, the reference does not teach stacking conductive particles having at least one of a particle shape, an elliptical shape, and a cylindrical shape and where one of the first electron collection layer and the second electron collection layer includes a plurality of rows, with the conductive material particles in each row separated by gaps, with a conductive material particle in one row being in contact with a conductive material particles in an adjacent row. For these reasons, the claims are allowed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
